A two-stroke petrol engine (used in scooters, motor cycles etc.). The cylinder L is connected to a closed crank chamber C.C. During the upward stroke of the piston M, the gases in L are compressed and at the same time fresh air and fuel (petrol) mixture enters the crank chamber through the valve V.

Some smaller engines, however, notably those fitted to some mopeds or motorcycles, operate on a two-stroke cycle - the piston is on a power stroke every time it moves down the cylinder so the crankshaft turns only once during each cycle. A few cars have used this engine too, such as the Wartburg

Two-stroke petrol engines are preferred when mechanical simplicity, light weight, and high power-to-weight ratio are design priorities. With the traditional lubrication technique of mixing oil into the fuel, they also have the advantage of working in any orientation, as there is no oil reservoir dependent on gravity; this is an essential ...

In this post I am going to tell you about the difference between two stroke and four stroke engines. The main difference between two and four stroke engine is that in 2 stroke engine the crankshaft revolve two times to complete its working cycle where as in 4 stroke, the crankshaft does 2 revolution to complete its working cycle.
